

Hiperwall Screen Sender Virtualization

HIPERWALL
see the big picture

It is possible to run multiple Hiperwall screen sender sessions on a single physical PC using most PC virtualization systems. This chart indicates the performance that Hiperwall testing produced for various quantities of virtual PCs running at different desktop resolutions. All tests were performed on an Intel i7 920 CPU with 6GB RAM using the Sun Virtual Box virtualization system. Each virtual PC was configured for single core operation.
